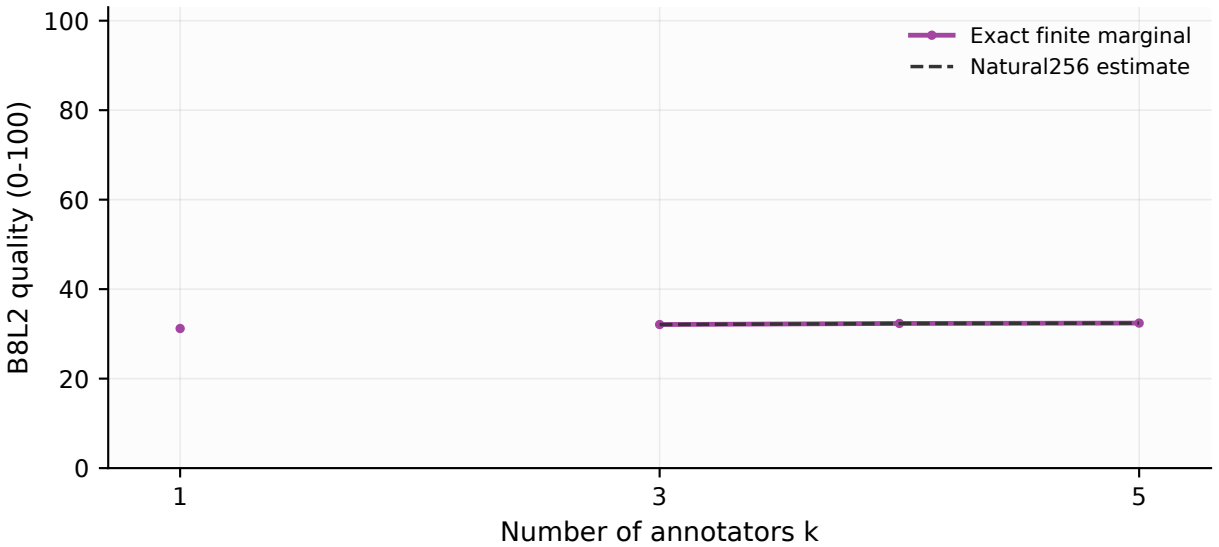
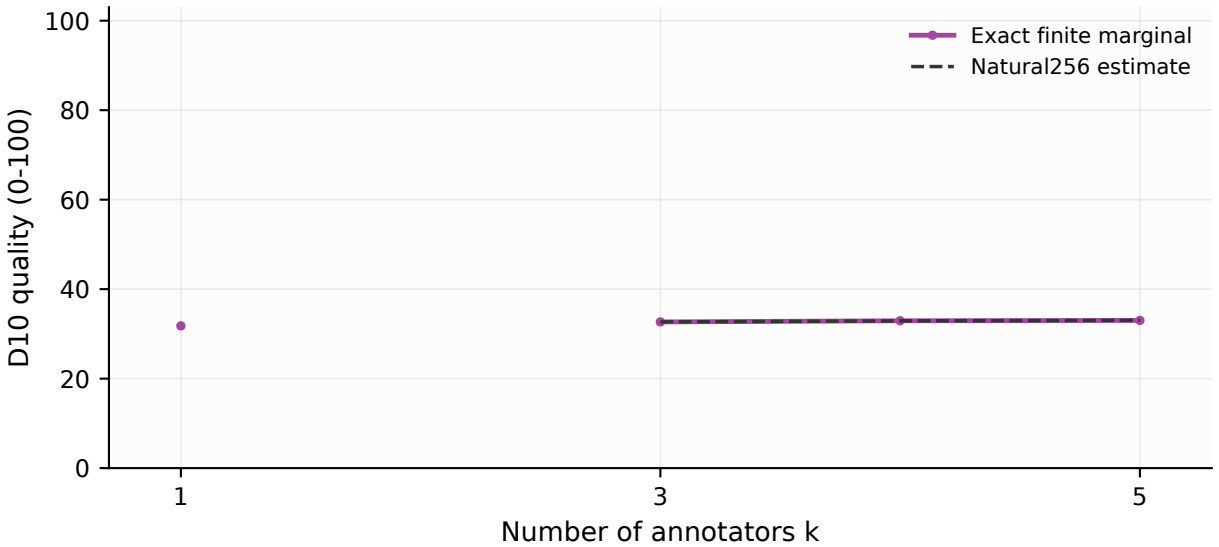
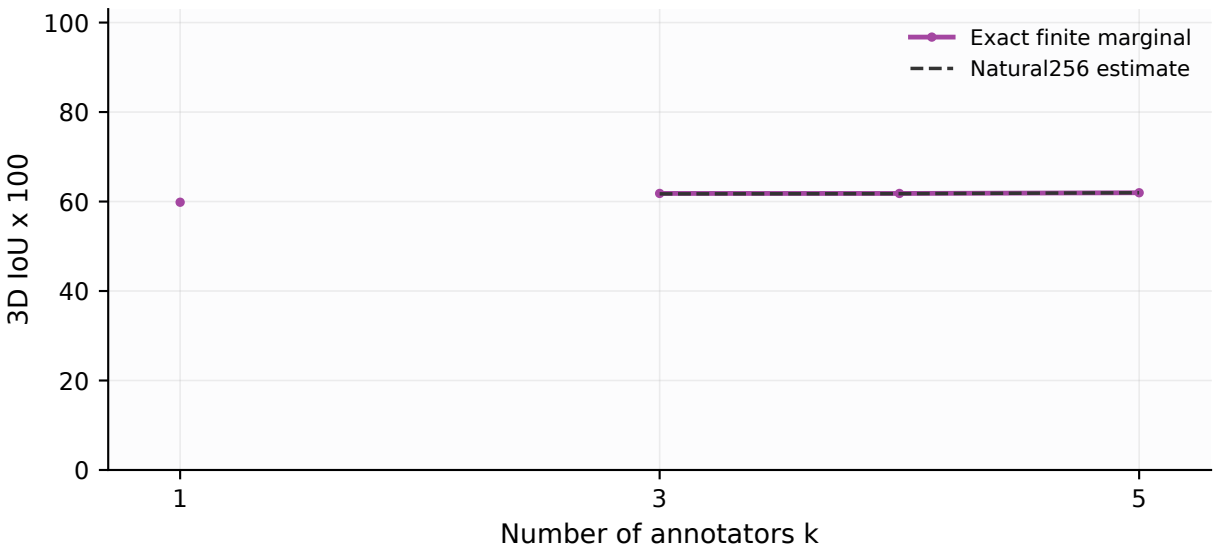
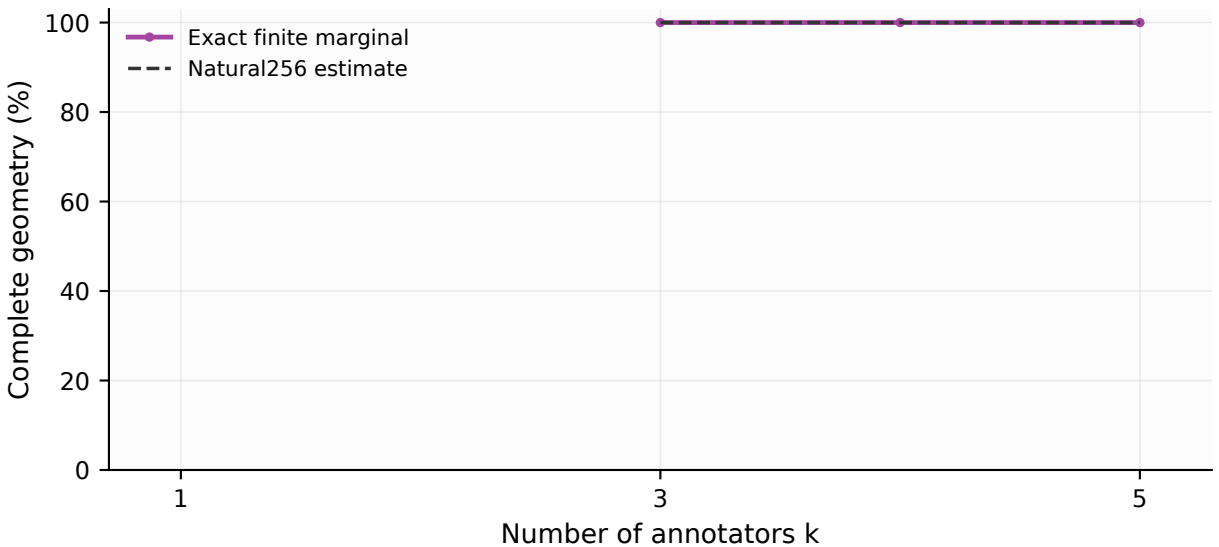
q9-04 Space 2: conditional derived full reference, N=5









Exact finite populations: k=3 has 10 teams; k=4 has 5; k=5 has 1. Q is conditional on score availability; completeness is separate.
The dashed-line discrepancy is Monte Carlo estimation error, not extra population variability. k=2 remains separate.
This is a preselected small-pool illustration; the full side panels and each target reference source are reported separately.
