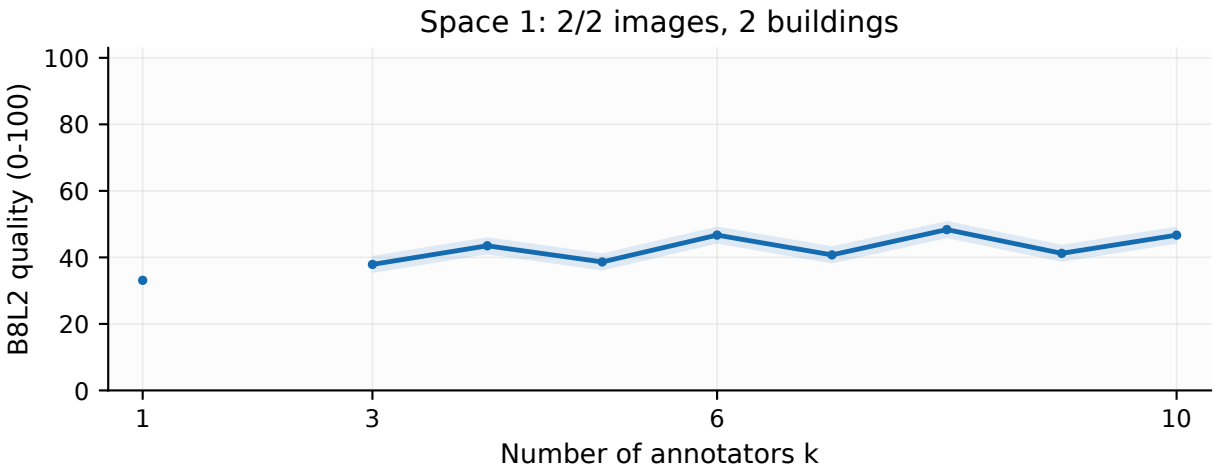
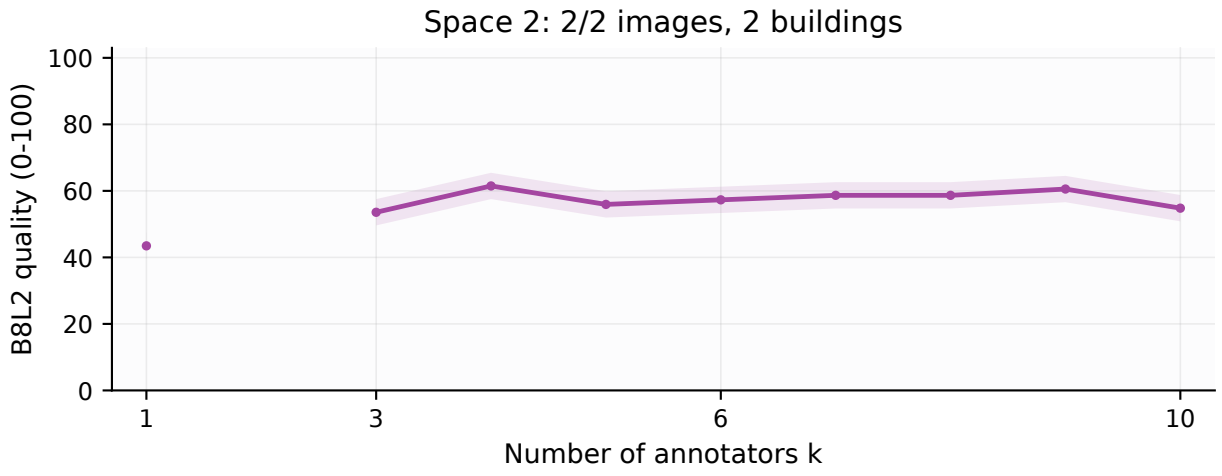
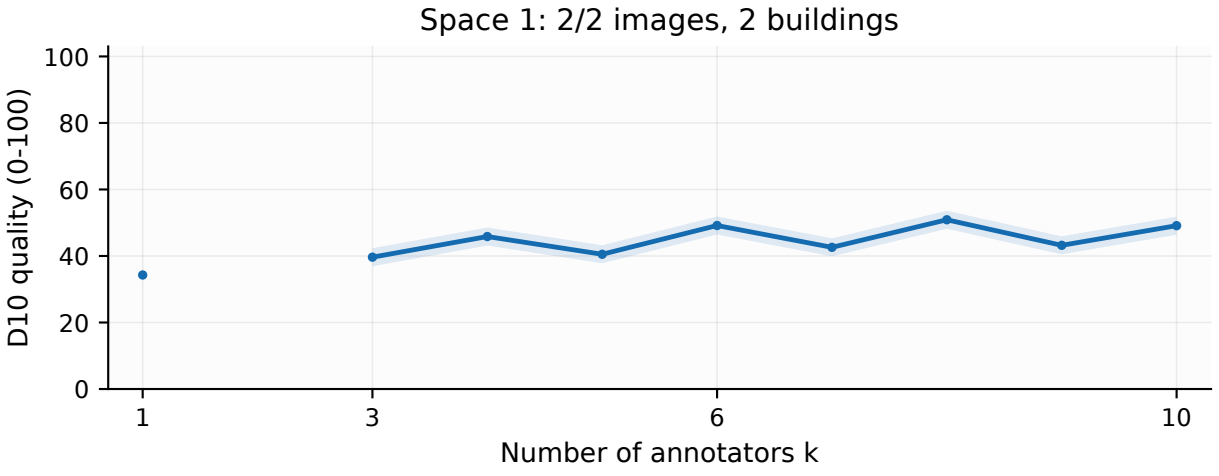
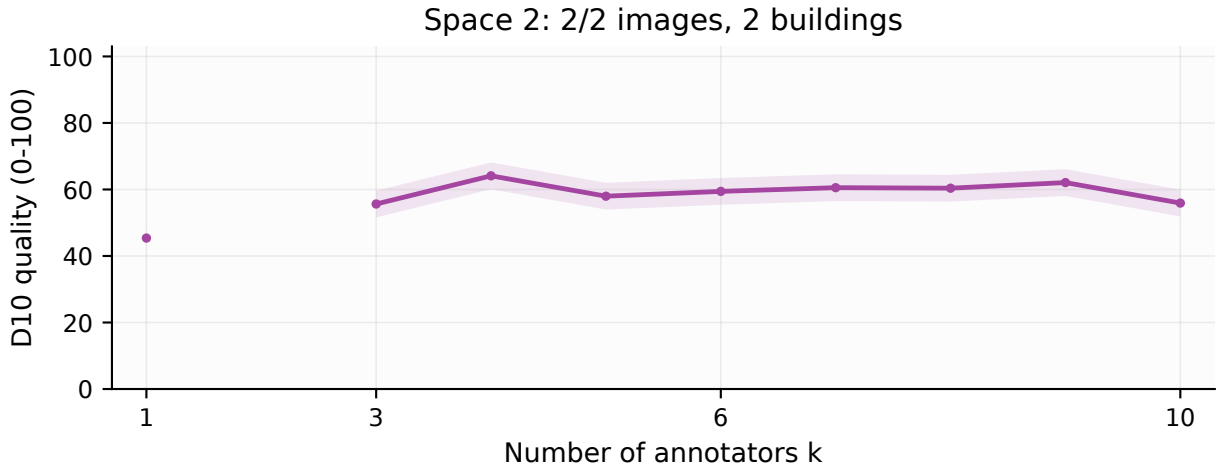
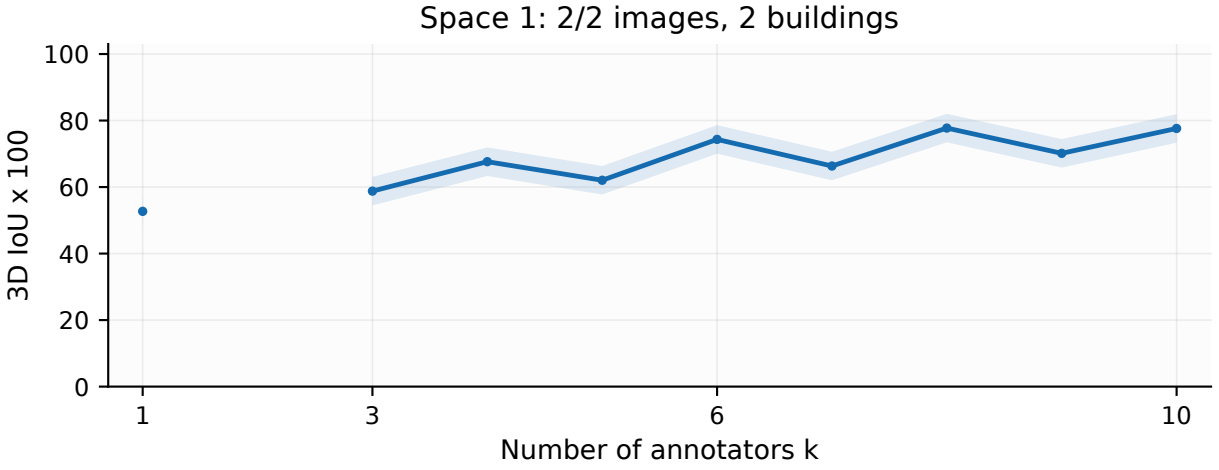
Single-side full quality: fixed capacity through k=10

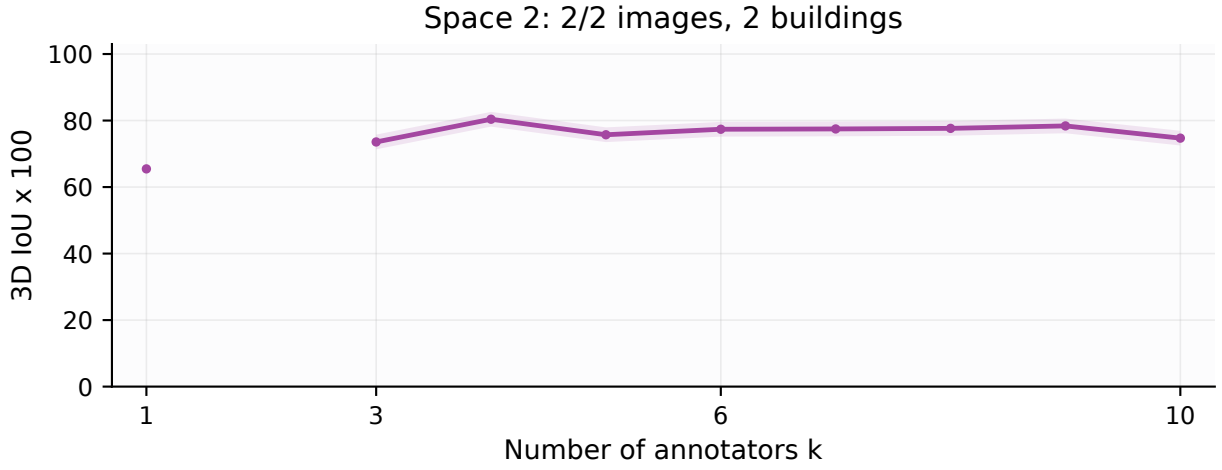


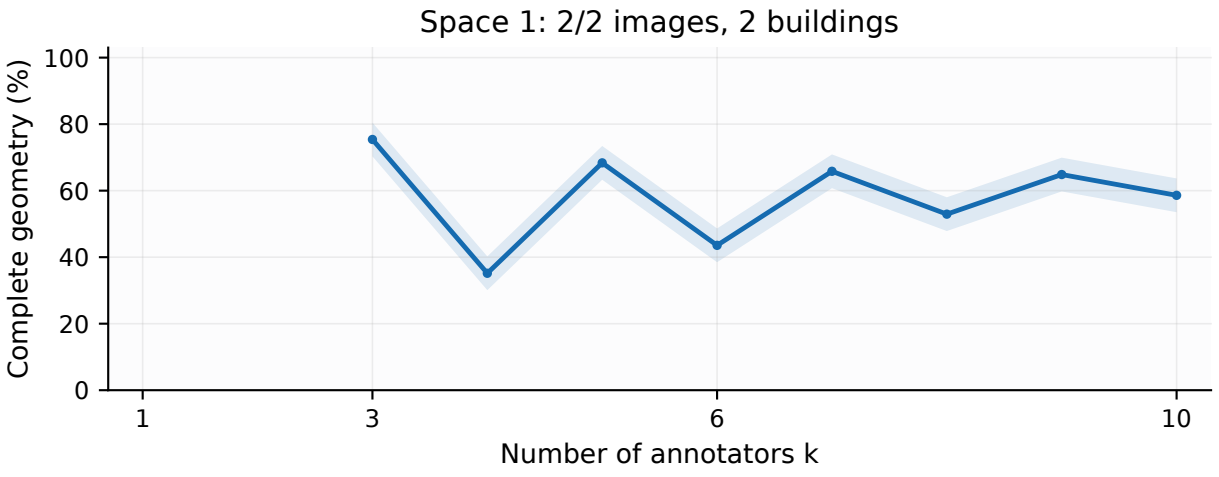


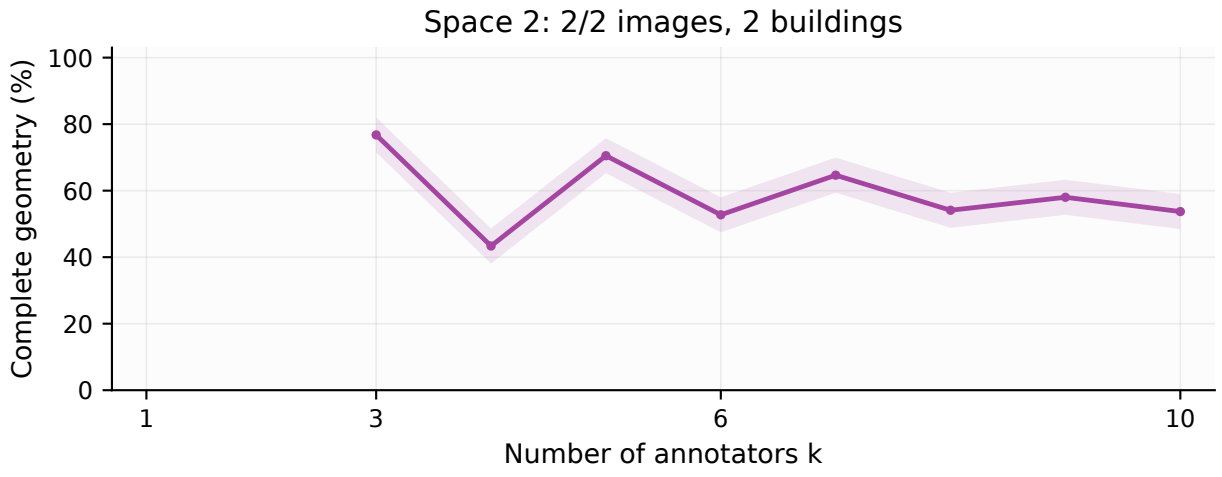












The two columns have different image supports; they are not a same-image side contrast. Each side has only two images; no image has capacity 10 on both sides.
Q is conditional on score availability; read with complete-output rates. Each target has its separately documented top/closure reference.
Shading: 95% whole-path Monte Carlo simultaneous bands. k=1 is sampled raw annotation quality; k=2 is separate.
