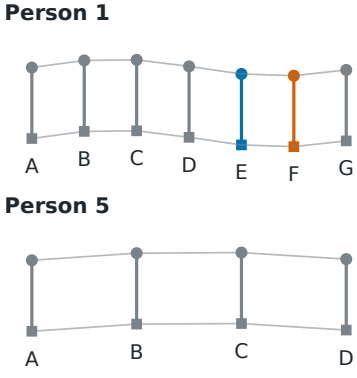
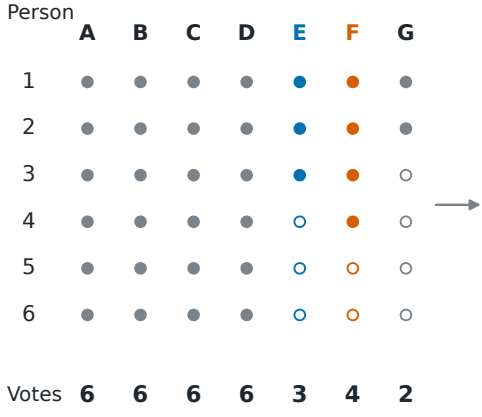
(a) Paired observations



Match top and bottom together.
Allow skipped observations;
preserve cyclic order.

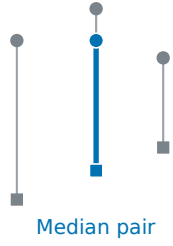
(b) Correspondence and support



n = 6: retain if votes ≥ 3

E is retained at exactly half the team.
G stays in the ledger but is not selected.

(c) Locate retained E



Horizontal: unwrap, then median.
Vertical: separate top/bottom medians.

Same supporters; equal weights.

(d) Source-supported order

Selected identities: A B C D E F

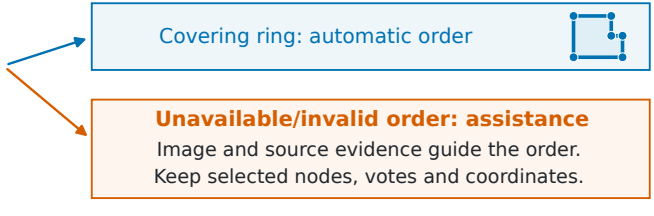
Source projection: A B C D E F A

Cover every selected identity once.

Choose the most-supported covering ring.

Cyclic shifts and reversal are equivalent.

(e) Automatic or assisted connection



Check validity; assess scorable outputs; record each branch.
