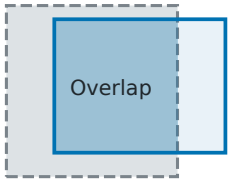
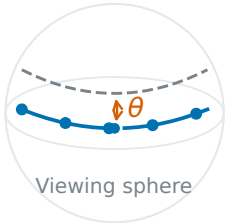
(a) Floor overlap I



I = intersection/union

Agreement in floor area

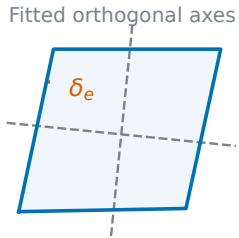
(b) Boundary placement S_b



Samples to continuous boundary arcs

Symmetric angular distance

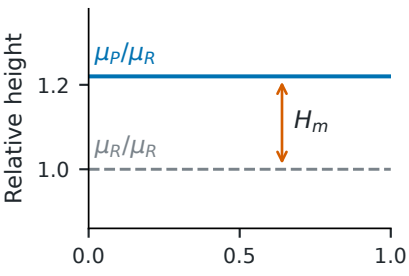
(c) Internal direction D_{dir}



Length-weighted residual

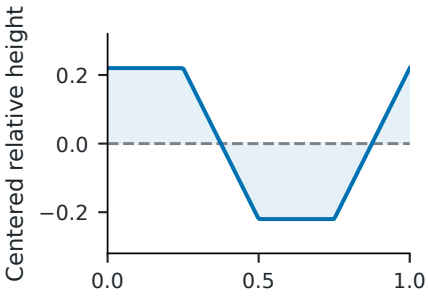
Relative to the layout's own axes

(d) Mean height H_m



Overall height mismatch

(e) Local height H_c



Same mean; different local heights

(f) Combined score Q

Floor + direction

$$\sqrt{F^2 + L_d^2}$$

Mean L_m + local L_c

$$Q = \frac{100}{1 + \sqrt{F^2 + L_d^2} + L_m + L_c}$$

Retain the five components with Q
